

Soliton CloudSecure Workspace™

Corporate Data, Locked down for Remote Users

Keep Your Network Safe From Attack

Web-based apps are now a common part of many organizations' IT strategy—but in practice, web browsers can cause many of the same headaches as any app, from frequent updates to user identification issues that result in security issues.

Soliton makes secure access to your enterprise simple and affordable!

Soliton offers a way to realize the benefits of web-based apps without the drawbacks. By containerizing web and cloud applications into a browser workplace, and then delivering it the same way to every user, IT can solve user identification issues while enhancing security and manageability.

Solution Overview

Soliton CloudSecure Workspace works well with any device. Following an easy sign-in, users can use CloudSecure Workspace as their default browser without restrictions, and access company data without the need of the complicated infrastructure that normally comes with secure access. This makes for a great user experience, while staying secure.

Protect Against Malware, Ransomware and Advanced Attacks.

As networks become increasingly central to business operations, they become increasingly attractive targets. To protect corporate networks from cyber attacks, it's tempting to want to isolate the network completely. But business doesn't take place in isolation. CloudSecure Workspace delivers digital resilience by reducing the surface area for attack. With CloudSecure Workspace, corporate data and web applications are accessed through a secured container area.

Prevent Data Leakage. Preventing data leakage is challenging for many companies. The fast growth of cloud services and BYOD has increased this risk even further. With CloudSecure Workspace, corporate web-based applications can be accessed securely without running the risk of data theft.

Highlights

Reduced Attack Surface

- Secured container completely contains desktop-based attacks
- Cache is automatically erased upon closing the browser; upon reopening, data is reloaded, unaffected by malware, ransomware, etc.
- Data cannot be accessed by other apps

Cost Effective

- Eliminates the need to set-up and configure an expensive VPN or maintain a complicated infrastructure
- Delivers the same speed as other browsers
- Less than 30% total cost of ownership compared to VDI, RDP, and VPN solutions
- Includes two-factor authentication (2FA), single sign-on (SSO) and ID Federation

Reduced IT Administration

- Manage user access to corporate data via a single point of control
- Patch, deploy and upgrade user applications with simple web application settings
- Easily block and/or disable unauthorized BYOD devices to prevent data leakage

Increase employee productivity and facilitate business mobility with secure, remote access to corporate apps and data.

CloudSecure Workspace – The Ideal Solution for Secure Access to Your Company Data “On-Prem” and “On the Go”

It's impossible to ignore the irony that enterprise remote access services – technologies meant to provide authorized employees and partners with managed, secure remote access to corporate networks and data – have become one of the most exploited IT resources in use today.

Insecure or insecurely used remote access technologies that most security teams assume pose little risk in reality offer an abundance of options for attackers to infiltrate enterprises.

Soliton CloudSecure Workspace changes all that.

Capabilities

- **Enable Secure Collaboration.** Enterprises today are information-intensive organizations. Managing secure access to data in the enterprise itself is a significant challenge, and that challenge is even more complex for firms that must share information with external partners. CloudSecure Workspace enables secure access for partners while preventing data leakage.

- **Provide Controlled, Safe Access for Users.** CloudSecure Workspace offers safe access to cloud applications by creating one access route to the enterprise application.
- **Reduce Device Management and Allow the Use of Private Devices.** CloudSecure Workspace works on your favorite devices (iOS, Android, Windows, Mac). Easy-to-use and lightning fast speed makes for a great user experience while staying secure.
- **Secure Access from Anywhere.** CloudSecure Workspace is ideal for those needing access to company data on public WIFI's, such as hotels or airports. If a device is lost, the data is still secure.
- **Prevent Unauthorized Access.** Certificate-based user and device authentication prevents access from unauthorized users and devices.
- **Lock Down Data.** A secure, virtualized workspace prohibits cut, paste, copy, print and data transfer to the local environment and prohibits the sharing of data to local area apps.
- **Easy to Implement. Easy to Scale.** The Soliton series of solutions are notoriously easy to install, configure and operate.

Our Mission is Your

Success. Over 17,000 enterprises worldwide trust Soliton for their multi-factor authentication and wireless access point needs.
